Application/Control Number: 09/384,315

Art Unit: 1712

The amendment after Final rejection mailed June 20, 2002 (Paper No. 15) has been denied entry since the phrase "and having 2 epoxide functional groups" in claim 20 and new claim 41, line 4 refers to a species such as a bisphenol A diglycidyl ether (the amendment filed July 23, 2001 (Paper No. 10, page 1, component (A) and page 2, lines 5-6) which is different from the copolymer of an unsaturated epoxide or an unsaturated epoxide-grafted polyolefin (specification, page 3, lines 16-18. There is no support nor enablement for the copolymer or grafted polyolefin "having 2 epoxide functional groups."

A comma should be inserted after the "copolymer made from an unsaturated carboxylic acid" for (C) in claims 20, 21, 41 and 42 to distinguish between the copolymer and the compound of an α , ω -aminocarboxylic acid such as aminoundecanoic acid (page 5, lines 22-24).

The 35 U.S.C. 103(a) rejection over Spelthann is maintained since the blending within a twin-screw continuous mixer of a thermoplastic polyolefin with an anhydride-functional copolymer (1)(b) (col. 3, lines 36-39, corresponding to claimed copolymer (B)), an ethylene/unsaturated monocarboxylic acid/carbon monoxide copolymer (2)(a) (col. 4, lines 23-29, corresponding to claimed copolymer (C)), and an ethylene/glycidyl (meth)acrylate copolymer (2)(b) (col. 1, lines 45-52, corresponding to claimed copolymer (C). The examples described on page 7, line 26 to page 8, line 11 of the specification are prepared via mixing within a twin-screw extruder.

Application/Control Number: 09/384,315

Art Unit: 1712

Page 3

Based on the equivalent anhydride, carboxyl and epoxide functionalities pendant

on equivalent copolymers combined in an equivalent manner via a twin-screw extruder,

the thermoplastic composition of Spelthann forms a crosslinked phase involving the

reactions between the anhydride and carboxyl groups with the epoxide groups of the

copolymers which do not patentably differ from that claimed.
